

15x15 tile

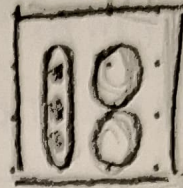

top

side

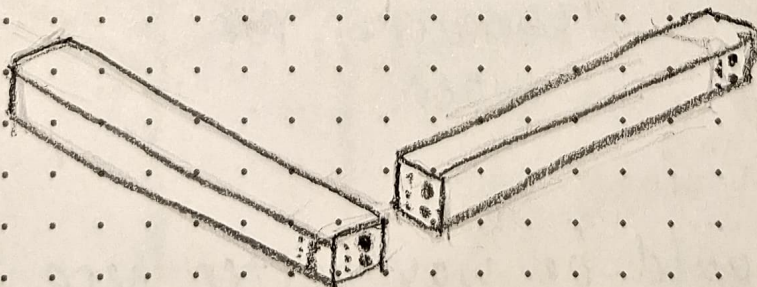

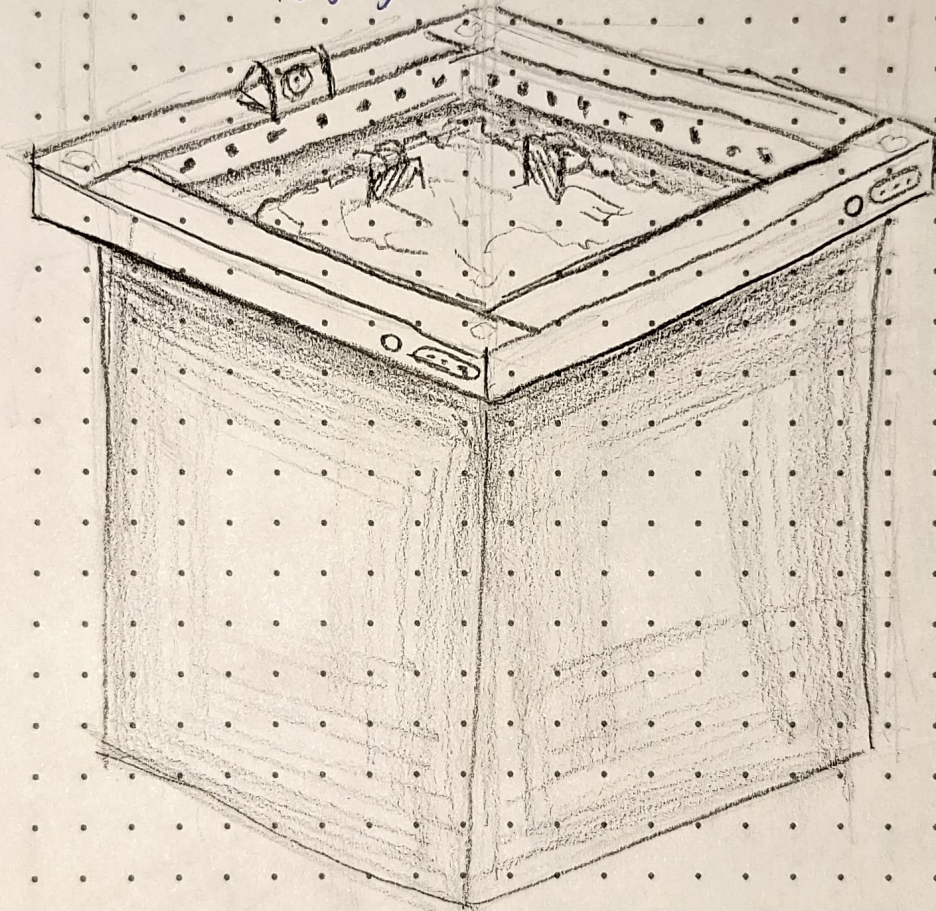

front

* only for water
routing hose
wires.

design v1

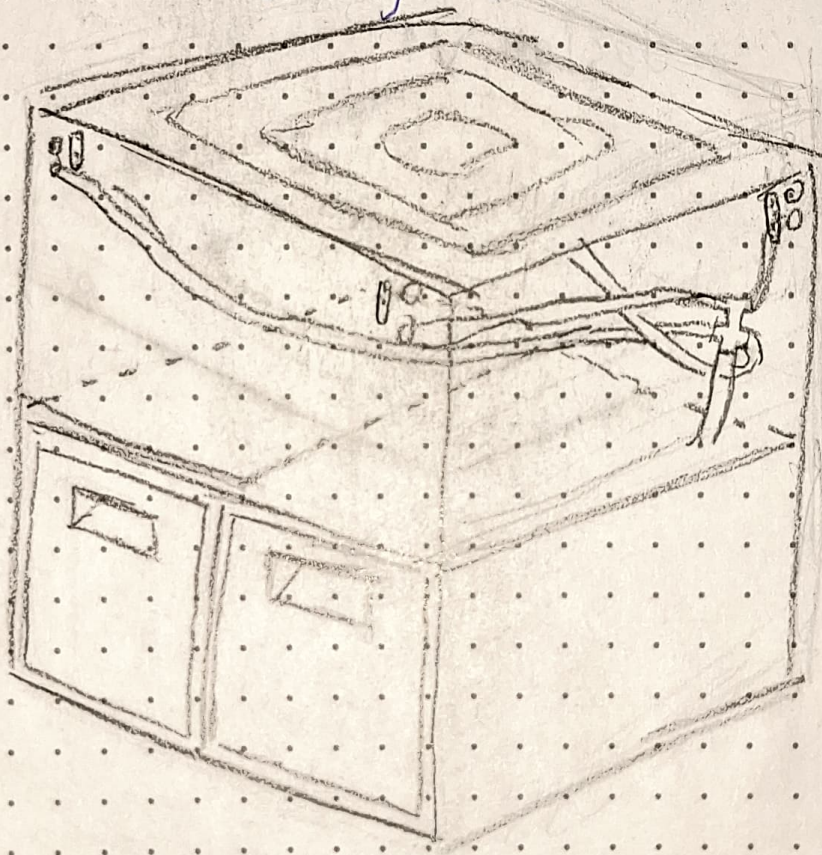

EVN

hub tile

- * the ~~design~~ design of the hub tile is not very complicated its more the hardware and software that are complicated

design v1

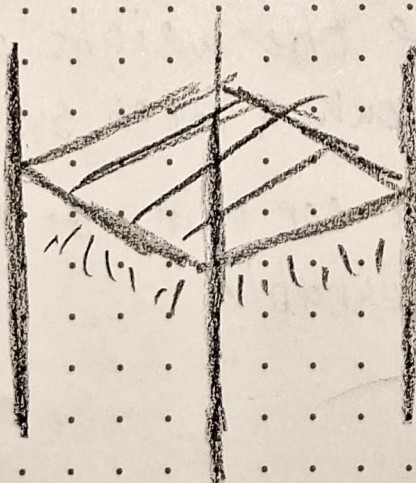

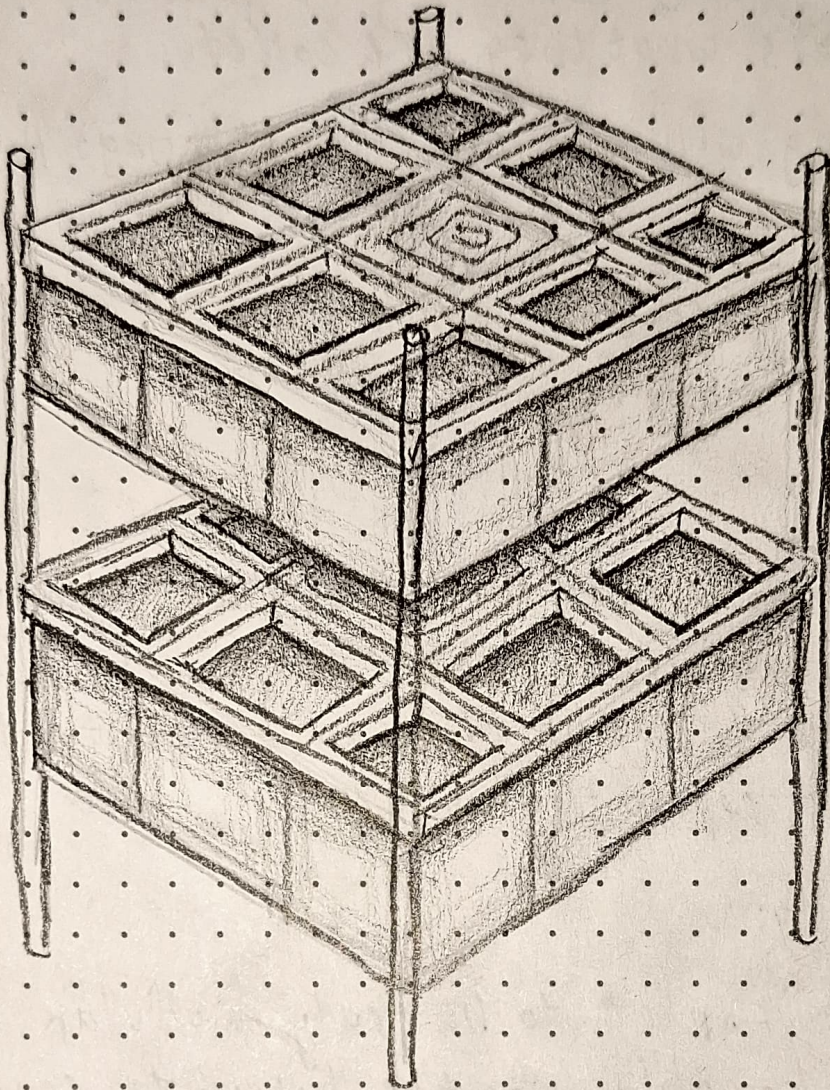

tubing

container for
water

- * tubing could be way better here i need to think of ideas.

how the tiles would look together

we could use these
sort of shelves to make
it on multiple floors
and they can include
the grow lights.

EVN

connections:

- the different parts should all be interchangeable
- the tubing will connect with quick release valves. i think thats what they are called.
- the wiring will ~~not~~ connect with pogo pins ~~can~~ preferably 4.
- the parts themselves would connect with neodymium magnets.

tubing:

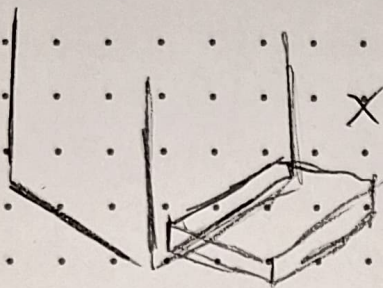

- the tubing is a big problem since idk how big of a tube i need and i need 2. But i haven't still thought of a good way to give each plant separately water

modularity:

- in order for it to be truly modular it needs to be able for the bottom to come out which i still have no idea how to do.
1. it cant be a latch since the weight of the dirt will easily break a latch system.
 2. it needs to be intuitive for using so it needs to be simple and durable.

modular bottom designs:

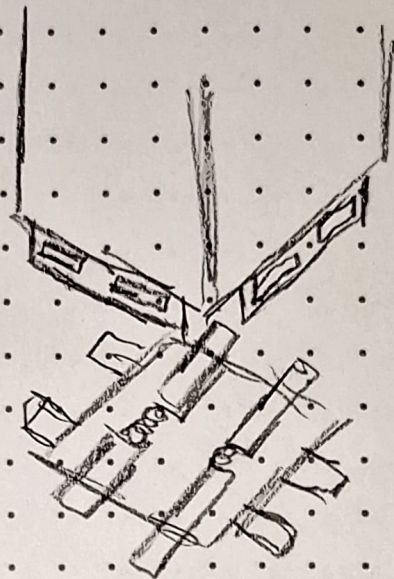

1.

basically a slab that
slides into a slot.
but this has weak
points and its not
really secure

how to connect
2 bottoms with
each other?

2.

basically have extensions
at the end that will be
like feet also and will
have holes in them.
In the holes would go
spring loaded rods that
are attached to the
bottom.
